

OPERATING SYSTEMS STUDY GUIDE

1. FCFS SCHEDULING

First-Come, First-Served (FCFS) allocates CPU in order of process arrival.

It is non-preemptive and causes the convoy effect where short processes wait behind long ones.

2. SJF SCHEDULING

Shortest Job First (SJF) selects the process with the shortest burst time.

SJF is provably optimal, giving minimal average waiting time for a given set of processes.

3. ROUND ROBIN SCHEDULING

Round Robin (RR) assigns a fixed time quantum (e.g. 10ms) per process in a circular queue.

It provides fast response time for interactive systems but increases context switching overhead.
